Multiple Security Levels

Merchants can sell some items or services and only require the buyer to enter their card number, expiration date and security code. They can require buyers to enter their zip code for other items. They can require extended zip code (nine digits) and street address for other items.

Authorize Only transactions can be used to avoid capturing funds before product is shipped or service is provided.

We enable the merchant or web designer to set the following values for an item by just completing a form. The product fields are:

1. Merchant ID
2. Product Code – no spaces permitted.
3. Number of Attributes – one or more attributes can be specified for product. The attributes can be like size, color, etc.
4. Product Description
5. Base Price – the attributes can increase the total price.
6. Card Security – see list below.
7. Authorize Only – **The amount must be captured by a separate transaction.** If a merchant uses more than one ANet security level, the levels other than the highest one are set to Authorize Only.
8. Require Text Phone Number - A six digit code is sent to the Text Number. The buyer must respond and provide the six digit code.

Card Security Levels	
0	Expiration and CVV only
1	Expiration, CVV and Zip Code
2	Expiration, CVV, Zip Code and Street
3	Expiration, CVV, Extended Zip Code and Street

Security Options		
1	Require text phone	
2	Two Step Security	
4	Require email	
8	Two Small Random Charges	
The variable nSecurityOptions is binary. The value is 5 when options 1 and 4 are turned on.
